

ABSTRACT OF THE DISCLOSURE

For members of a party visiting a space with which media objects are associated, the
5 shared experience can be enhanced by the sharing of such objects by the group members
for presentation on devices for example carried by the group members. Where the media
object is a streamed media object, the experience can be further enhanced by coordinating
the consumption of the object by the group members. To this end, a server streaming the
media object to a first device is arranged to respond to a request for coordinated
10 consumption by establishing streaming of the object to a second device starting from a
position in the media object that is dependent on progress of the streaming/presentation of
the object to/at the first device.
